Volume II begins with a discussion of Euclidean Manifolds which leads to a development of the analytical and geometrical aspects of vector and tensor fields. We have not included a discussion of general differentiable manifolds. However, we have included a chapter on vector and tensor fields defined on Hypersurfaces in a Euclidean Manifold.

In mathematics, a field is a set on which addition, subtraction, multiplication, and division are defined and behave as the corresponding operations on rational and real numbers do. A field is thus a fundamental algebraic structure which is widely used in algebra, number theory, and many other areas of mathematics...The best known fields are the field of rational numbers, the field of real ...

Either one runs the risk of making a visibly weak case for the applicability of the notions of abstract algebra, or on the other hand—by including substantive

8.2), the quantum observables Obsq form a factorization algebra over the ring R[[h]]. Moreover, the factorization algebra of classical observables Obscl is homotopy equivalent to Obsq mod h as a factorization algebra. Thus, the quantum observables form a factorization algebra and, in a very weak sense, are related to the classical observables.
