APDL is the foundation for design optimization and adaptive meshing. ANSYS uses two types of parameters: scalar and array. You can use a parameter (instead of a literal number) as an argument to any ANSYS command; the parameter is evaluated and its current value is usedfor that argument. If the parameter name is input in a numeric argument of acommand, the numeric value of the parameter is substituted into the command at thatpoint.

APDL stands for Ansys Parametric Design language.That means you are writing the program, often in batch mode, as opposed the point and click operations in a GUI as you would be doing in Workbench.You can also use a combination approach by setting up general things that are much easier to do in a GUI and then applying APDL commands to do more complicated things.please refer Nick Meyers answers for more insight.

The interactive part of the ANSYS Mechanical UI is handled primarily through the use of javascript. Javascript is an interpreted scripting language that is most popular in the context of web development. It is text based, i.e. it isn't compiled. The way it works is that there is a javascript interpreter built into the ANSYS Mechanical executable.
