Border Gateway Protocol (BGP) is the routing protocol used to exchange routing information across the Internet. It makes it possible for ISPs to connect to each other and for end-users to connect to more than one ISP. BGP is the only protocol that is designed to deal with a network of the Internet's size, and the only protocol that can deal well with having multiple connections to unrelated routing domains. This book is a guide to all aspects of BGP: the protocol, its configuration and ...

Routing Protocols (such as BGP, OSPF, RIP, EIGRP, etc...) are designed to help routers advertise adjacent networks and since the internet is a network of networks, BGP helps to propagate these networks to all BGP Routers across the world. BGP is defined by IETF in RFC 4271 and we are currently on version 4 (BGP4 or BGP-4) since 2006.

'BGP' by Iljitsch van Beijnum

The slow BGP convergence dictates a two-protocol design of an ISP network: An internal routing protocol -- most often, Open Shortest Path First (OSPF) or Intermediate System to Intermediate System (IS-IS) -- is used to achieve fast convergence for internal routes, including IP addresses of BGP routers. BGP is used to exchange internet routes.
