Mitosis is the process by which genetic matter gets identically replicated many times over. Since cancer is caused by a damage or mutation to cellular DNA, mitosis plays an active role in spreading cancer in the body by making exact copies of these damaged and mutated cellular genetic materials.

Mitosis And Cancer And the Cell Cycle Pre Lab ...

Mitosis is closely controlled by the genes inside every cell.

Sometimes this control can go wrong. If that happens in just a single cell, it can replicate itself to make new cells that are also out of control. These are cancer cells. They continue to replicate rapidly without the control systems that

Also in cancerous cells you will see more cell division in the cell because they preform differently and they may have a gene that's damaged. Therefore, if i'm correct i will see a greater amount of tissue divided in the process of mitosis.
