There are many physical tests, or 'special tests', that are used by clinicians in physical therapy, and orthopedics / orthopaedics in general, during a physical examination. These tests are used to rule in or out specific musculoskeletal problems. They help in the differential diagnosis of orthopedic conditions and injuries.

The clinical examination of a knee is addressed to evaluate three aspects: 1) patello-femoral joint/extensor mechanism; 2) articular (meniscal and chondral) lesions; and 3) knee instability. The series of the most known exams, signs and tests used for each of the three aspects will be here discussed.

Clinical examination of the knee: know your tools for ...

Shoulder pain is one of the most common complaints in the outpatient setting. The etiology is most of the time traumatic and related either to sport or accidents. Other causes are degenerative joint disease and arthritis. In each case it is important to be familiar with some basic examination tools that can help us confirm the presence of a shoulder lesion.
