Code Block Functions Functions can be created in a code block and recalled elsewhere in a Dynamo definition. This creates another layer of control in a parametric file, and can be viewed as a text-based version of a custom node. In this case, the "parent" code block is readily accessible and can be located anywhere on the graph.

Return a value with "return =". Code Blocks that define a function do not have input or output ports because they are called from other Code Blocks. Call the function with another Code Block in the same file by giving the name and the same number of arguments. It works just like the out-of-the-box nodes in your library. \*\* This image was ...
