Made from DNA, RNA plays a variety of roles in a cell, including the creation of proteins and the expression of genes — functions that, when disrupted, can lead to cancer. Messenger RNA (mRNA), for example, carries DNA's instructions out of the nucleus to structures called ribosomes, where proteins are made.

DNA is generally double-stranded and RNA is generally single-stranded (though both can exist in either form). Prokaryotes contain both DNA and RNA. Finally, DNA is transcribed to RNA in most biological organisms, but RNA can be reverse transcribed to DNA by the protein reverse transcriptase, which is found in some viruses.
