AXES OF AN AIRCRAFT Aircraft is completely free to move in any direction Manoeuvre dive, climb, turn and roll, or perform combinations of these. Whenever an aircraft changes its attitude in flight, it must turn about one or all of these axes. Axes - imaginary lines passing through the centre of the aircraft.

EASA PART-66 MODULE 8.4 : FLIGHT STABILITY AND DYNAMICS

Flight dynamics is the science of air vehicle orientation and control in three dimensions. The three critical flight dynamics parameters are the angles of rotation in three dimensions about the vehicle's center of gravity (cg), known as pitch, roll and yaw. Control systems adjust the orientation of a vehicle about its cg. A control system includes control surfaces which, when deflected, generate a moment (or couple from ailerons) about the cg which rotates the aircraft in pitch, roll, and yaw.

Flight dynamics (fixed-wing aircraft) - Wikipedia

Flight dynamics (fixed-wing aircraft) - Wikipedia Stability is the ability of an aircraft to correct for conditions that act on it, like turbulence or flight control inputs. For aircraft, there are two general types of stability: static and dynamic. Most aircraft are built with stability in mind, but that's not always the case. Some aircraft, like training airplanes, are built to be very stable.

Next, the stability properties of hovering flight and forward flight are scrutinized. Then the flight control properties are explored, dealing in turn with flight stabilization control, steady-state control for changing from hovering to forward flight and from one forward-flight speed to another, and control for maneuvers near hovering.
