Pathophysiology

Jaundice results from high levels of bilirubin in the blood. Bilirubin is the normal breakdown product from the catabolism of haem, and thus is formed from the destruction of red blood cells. Under normal circumstances,

pancreas.

Pathophysiology of Jaundice

Jaundice - American College of Surgeons

Jaundice is a yellowish discoloration of the skin, the conjunctivae, and other mucous membranes caused by hyperbilirubinemia .

Generally, the serum bilirubin level needs to exceed 2.5 to 3 times the upper limit of normal (0.5–1.0 mg/dL) before jaundice is apparent.
