**Protein C And S Deficiency**  
Congenital protein C or S deficiency is an inherited disorder. This means it is passed down through families. Congenital means it is present at birth. The disorder causes abnormal blood clotting. One in 300 people has one normal gene and one faulty gene for protein C deficiency. Protein S deficiency is much less common and occurs in about 1 in 20,000 people.

**Congenital protein C or S deficiency: MedlinePlus Medical ...**  
Congenital Protein S and Protein C Deficiency are Inherited or Genetic Clotting Disorders. Protein S and Protein C are both natural substances in the blood that help to keep the blood from clotting. They act like natural anticoagulants or natural blood thinners.

**Protein S & Protein C Deficiency Resources | Blood Clots**  
Protein C deficiency is a disorder that increases a person's risk to develop abnormal blood clots due to a deficiency of the Protein C, a protein in the body that prevents blood clotting. It may be inherited or acquired. Inherited deficiency of protein C can lead to familial thrombophilia (increased tendency toward thrombosis). It is caused by mutations in the PROC gene, and in most cases is ...

**Protein C deficiency | Genetic and Rare Diseases ...**  
Protein C deficiency is a rare genetic trait that predisposes to thrombotic disease.It was first described in 1981. The disease belongs to a group of genetic disorders known as thrombophilias.Protein C deficiency is associated with an increased incidence of venous thromboembolism (relative risk 8-10), whereas no association with arterial thrombotic disease has been found.

**Protein C deficiency - Wikipedia**  
Conditions that can lead to a protein C deficiency include: vitamin K deficiency use of blood thinners such as warfarin (Coumadin, Jantoven) liver failure widespread metastatic tumors severe illness, including infection disseminated intravascular coagulation

**Protein C Deficiency: Diagnosis, Treatment, and More**  
Protein C deficiency is a genetic disorder characterized by a deficiency of protein C, which is a natural anticoagulant. This means it helps to prevent the blood from clotting too much. There is a form due to inheritance of a single abnormal protein C gene in which affected individuals are at risk for developing blood clots, particularly a type ...

**Protein S Deficiency - NORD (National Organization for ...**  
Protein C deficiency occurs when a person is unable to produce strong enough protein C or do not have enough of the protein in their body. This deficiency upsets the balance in the bloodstream.

**Protein C deficiency: Causes, symptoms, and treatment**  
Protein C and protein S are two proteins in the blood that help regulate blood clot formation. Two separate tests for these proteins are often performed together as part of the investigation of a possible excessive clotting disorder.

**Protein C and Protein S | Lab Tests Online**  
Protein C deficiency is caused by alterations (mutations) in the PROC gene. The milder form is caused by an alteration in one PROC gene and is inherited in an autosomal dominant manner. The severe form is caused by an alteration in both PROC genes and is inherited in an autosomal recessive manner. NORD Video: Protein C and Protein S Deficiency

**Protein C Deficiency - NORD (National Organization for ...**  
The available information all suggest that deficiency of protein C and protein S should be considered a risk factor contributing to recurrent thrombotic disease and that the function of these proteins is altered by many common clinical conditions which have associated an increased risk of thrombosis.

**Anticoagulation proteins C and S**  
Protein S deficiency is a disorder that causes abnormal blood clotting. When someone bleeds, the blood begins a complicated series of rapid chemical reactions involving proteins called blood coagulation factors to stop the bleeding. Other proteins in the blood, such as protein S, usually regulate these chemical reactions to prevent excessive clotting.

**Protein S deficiency | Genetic and Rare Diseases ...**  
Because protein S binds and assists activated protein C in the degradation of coagulation factors Va and VIIIa, deficiency of protein S predisposes to venous thrombosis. (See also Overview of Thrombotic Disorders.) Protein S, a vitamin K-dependent protein, is a cofactor for activated protein C-mediated cleavage of factors Va and VIIIa.

**Protein S Deficiency - Hematology and Oncology - Merck ...**  
From Wikipedia, the free encyclopedia Protein S deficiency is a disorder associated with increased risk of venous thrombosis. Protein S, a vitamin K -dependent physiological anticoagulant, acts as a nonenzymatic cofactor to activate protein C in the degradation of factor Va and factor VIIIa.

**Protein S deficiency - Wikipedia**  
Protein S deficiency is a disorder of blood clotting. People with this condition have an increased risk of developing abnormal blood clots. Individuals with mild protein S deficiency are at risk of a type of clot called a deep vein thrombosis (DVT) that occurs in the deep veins of the arms or legs. If a DVT travels through the bloodstream and lodges in the lungs, it can cause a life ...

**Protein S deficiency: MedlinePlus Genetics**  
Protein C deficiency is associated with a small percentage of cases of inherited thrombophilia, as well as the even more uncommon findings of warfarin-induced skin necrosis and neonatal purpura fulminans, and a possible weak association with pregnancy loss. However, establishing a diagnosis of hereditary protein C deficiency can be difficult ...

**Protein C Deficiency - UpToDate**  
Causes of inherited thrombophilia include antithrombin deficiency, deficiencies of proteins C and S, and Factor V Leiden mutation. Many patients with thrombophilia receive anticoagulant therapy for primary or secondary prevention of VTE, historically either warfarin or a heparin product.

Protein C deficiency may be weakly associated with late and recurrent pregnancy loss. In the European Prospective Cohort on Thrombophilia, the odds ratio (OR) for stillbirth (defined as pregnancy loss at > 28 weeks' gestation) among women with an inherited thrombophilia was 3.6 (95% confidence interval [CI] 1.4-9.4), whereas the risk of miscarriage before 28 weeks' gestation in this cohort was ...

Protein S is a co-factor for the action of activated protein C (APC) on activated factor V and activated factor VIII. 60% of protein S in the plasma is inactive, being bound to a binding protein. Protein S deficiency is associated with an increased risk of thrombosis.

**Protein S Deficiency. Learn about Protein S Deficiency ...**  
A rare thrombophilia disorder characterized by deficiency of protein s. It results in venous thromboembolism. An absence or deficiency in protein c which leads to impaired regulation of blood coagulation. It is associated with an increased risk of severe or premature thrombosis. (stedman's med.
