Metallic Material Testing Standards focus on hardness, tensile, and fatigue testing, approaching the issues from multiple angles to provide a range of information. In addition, metallic material testing standards cover corrosion testing, weld testing, and other areas of interest.

Tensile testing of metallic materials is specified according to European EN 10002 standard. In this article the terms, definitions and designation for tensile test made at ambient temperature is described. The test involves straining a test piece in tension, generally to fracture, for the purpose of determining mechanical properties.
