The theory of elasticity treats the relationship between forces applied to an object and the resulting deformations. In practice, the analysis of the elastic behaviour of a material is reduced to the study of simple deformations and the determination of the corresponding elastic constants.

What differentiates the elastic and plastic theory of structures is the constitutive behavior. The other two groups of equations ie, the equations of equilibrium, Eq.(252 and 253 of Part I), and the strain-displacement relations remain the same.
