DESIGN AND ANALYSIS OF RETAINING WALLS 8.1 INTRODUCTION Retaining walls are structures used to provide stability for earth or other materials at their natural slopes. In general, they are used to hold back or support soil banks and water or to maintain difference in the elevation of the ground surface on each of wall sides.

July 16, 2020. Share. Stability analysis of structures is mainly considered as sliding, overturning and uplifting. Sliding and overturning are due to lateral loads and uplift are due to the upward pressure created by liquids. Design a simple retaining wall may not need to follow the procedure mention in this article.
